# WEEKLY HEALTH REPORT

## NATURE OF THE DATA

The data presented here are taken from the Statistical Health Reports, Form 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

### MORBIDITY DATA

Admissions are reported only for cases hospitalized or confined to quarters and excused from duty for 24 hours or more, except for certain cases carded for record only (chiefly venereal disease cases which are treated on a duty status, and deaths which occurred before being "admitted" to hospital or quarters). Admissions designated as "injury" comprise all traumatisms (i.e., morbid conditions due to external causes, including poisons taken internally, results of exposure to heat, cold and light, and reactions to medications). Bearing in mind that under present conditions there would not be any direct admissions in the continental United States properly classifiable as battle casualties, all other cases are classified as "disease."

Admissions rates are shown for all causes combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The number of patients remaining in hospital at the end of the week per thousand strength as given in this report furnishes an approximation to the current non-effective rate. The mean number of non-effectives per thousand strength is given in the summary table for the total United States and for each of the Service Commands.

### MORTALITY DATA

Recent studies indicate that the reporting of deaths on Forms 86ab is incomplete, especially in the case of deaths from injury. The resulting understatement in the mortality rate from injury may be as much as 25 percent and occasionally even more, but the death rate from disease is not materially understated. Therefore in computing mortality rates from injury and from all causes on the basis of the corresponding numbers of deaths, as shown in this report, an appropriate adjustment for the underreporting of such deaths must be made.

### STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having strength of 5000 or over) with the highest morbidity rates from all causes, from all

diseases combined, from injuries, and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

### HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of bed capacity (normal and total), total beds occupied and beds "available vacant."

Unless otherwise specified, normal bed capacity in this report is defined in Par. 36b (1) and (2) of AR40-1080, 10 December 1943, and Par. 14 WD Circular 43, 1 February 1944. This includes the T/O capacity of non-fixed hospitals but excludes convalescent facilities. Total beds include expansion beds in addition to normal beds. Beds in dispensaries, convalescent facilities, venereal disease facilities, and college or university training units are not included in the tabulations for individual stations.

The number of beds "available vacant" is defined as 80% of the total capacity less the corresponding beds occupied. The number of beds "available vacant" for each Service Command is the total beds "available vacant" for only those stations in which 80% of the total bed capacity exceeds the beds occupied.

In the case of general hospitals there are shown, in addition, the number of Army patients admitted and disposed of during the week (by death, return to duty, transfer, or otherwise), the number of such patients remaining in hospital (including convalescent facilities, if any) at the end of the week, and corresponding data for battle casualties. The bed capacity and beds occupied in convalescent facilities are also indicated. The patients "otherwise" disposed of represent for the most part discharges on account of disability. In the case of Army battle casualties, all of which are currently admitted to general hospitals in this country as transfers, there is shown for each hospital the net number transferred during the week; i.e., admissions by transfer less dispositions by transfer. The total for the country as a whole represents the number of battle casualties evacuated to the United States from overseas theaters.

### EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where the current week's data for a particular station has not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

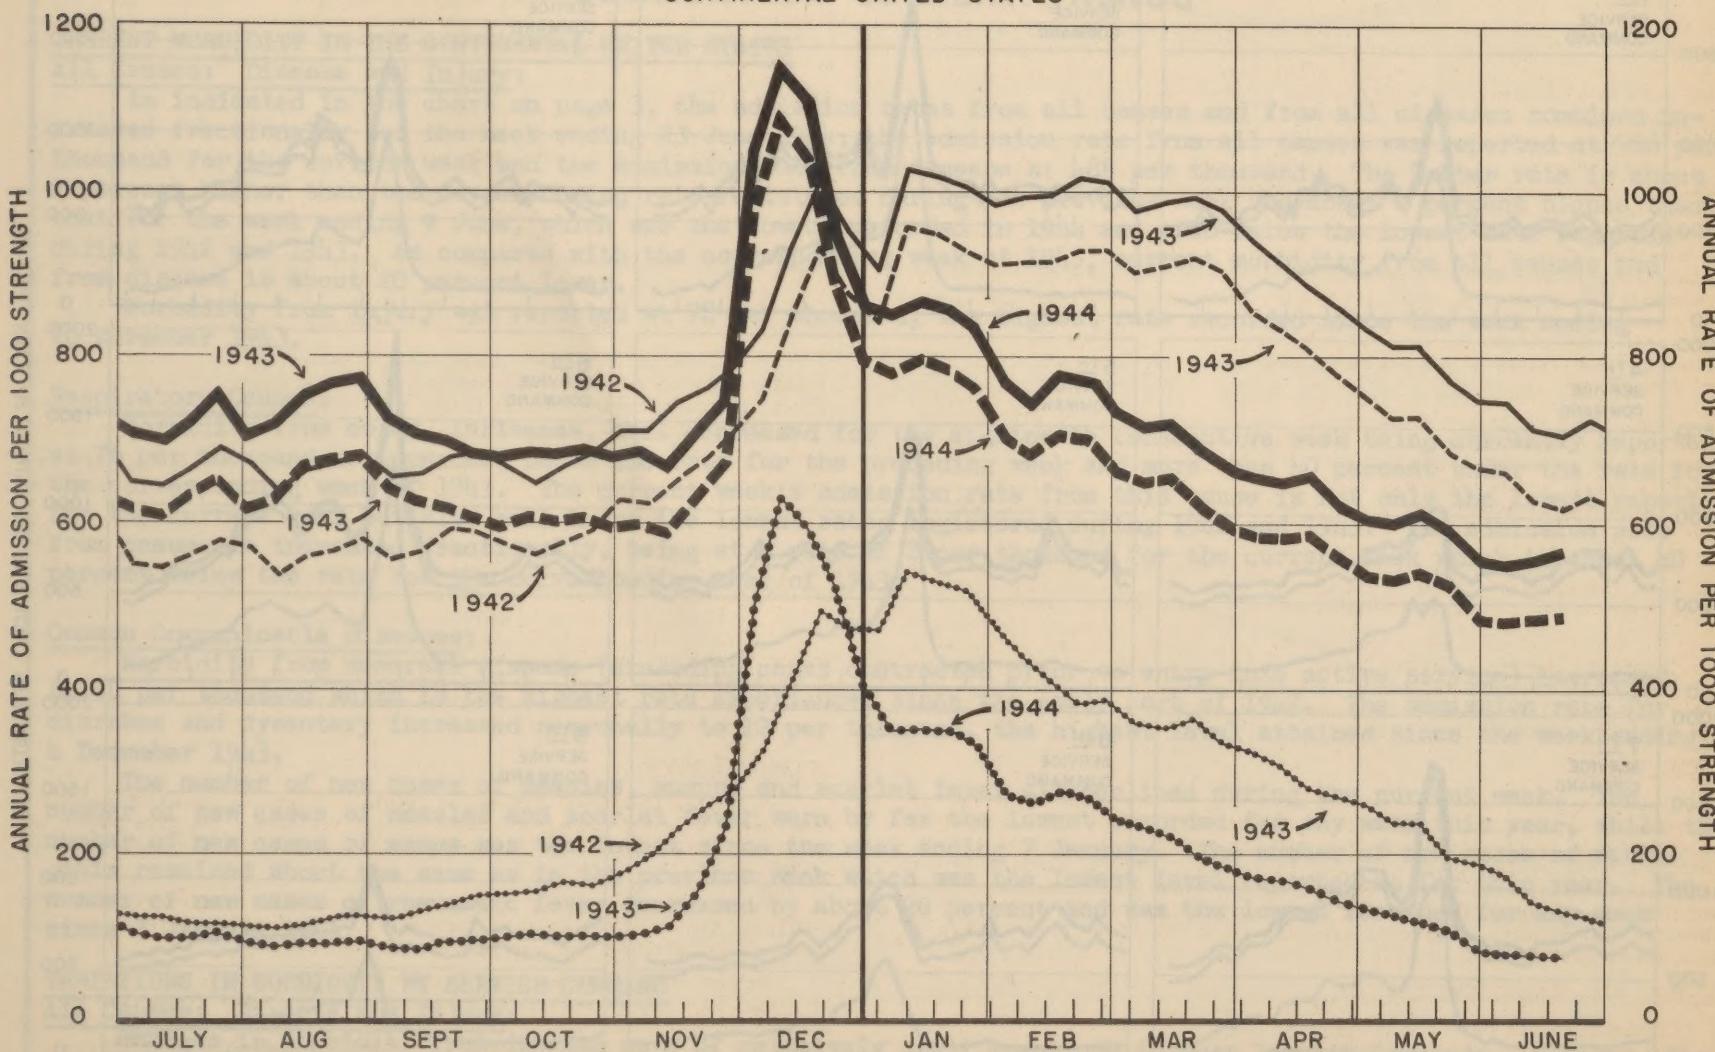

Because troops in transit and certain small detachments are not required to submit Reports, as well as for other reasons, the total strength of the reporting units as shown on this report has been consistently about four percent under the actual strength of the Army in the Continental United States.

## COMMENT ON CURRENT TRENDS

### CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES

#### All Causes: Disease and Injury:

As indicated in the chart on page 3, the admission rates from all causes and from all diseases combined increased fractionally for the week ending 23 June 1944; the admission rate from all causes was reported at 566 per thousand for the current week and the admission rate from disease at 488 per thousand. The latter rate is about 1 percent higher than the corresponding rate registered during the previous week and about 2 percent higher than that for the week ending 9 June, which was the lowest recorded in 1944 and also below the lowest rate reported during 1942 and 1943. As compared with the corresponding week of 1943, current morbidity from all causes and from disease is about 20 percent lower.

Morbidity from injury was reported at 78 per thousand, the highest rate recorded since the week ending 20 November 1943.

#### Respiratory Causes:

Morbidity from colds, influenza, etc., decreased for the eighteenth consecutive week being currently reported at 76 per thousand or 4 percent below the rate for the preceding week and more than 40 percent under the rate for the corresponding week of 1943. The current week's admission rate from this cause is not only the lowest reported for the current year but also well below the lowest rates registered during 1942 and 1943. The admission rate from pneumonia increased fractionally, being at a rate of 8 per thousand for the current week which is about 40 percent below the rate for the corresponding week of 1943.

#### Common Communicable Diseases:

Morbidity from venereal disease (excluding cases contracted prior to entry into active service) increased to 34 per thousand which is the highest rate experienced since the early part of 1942. The admission rate for diarrhea and dysentery increased seasonally to 12 per thousand, the highest level attained since the week ending 4 December 1943.

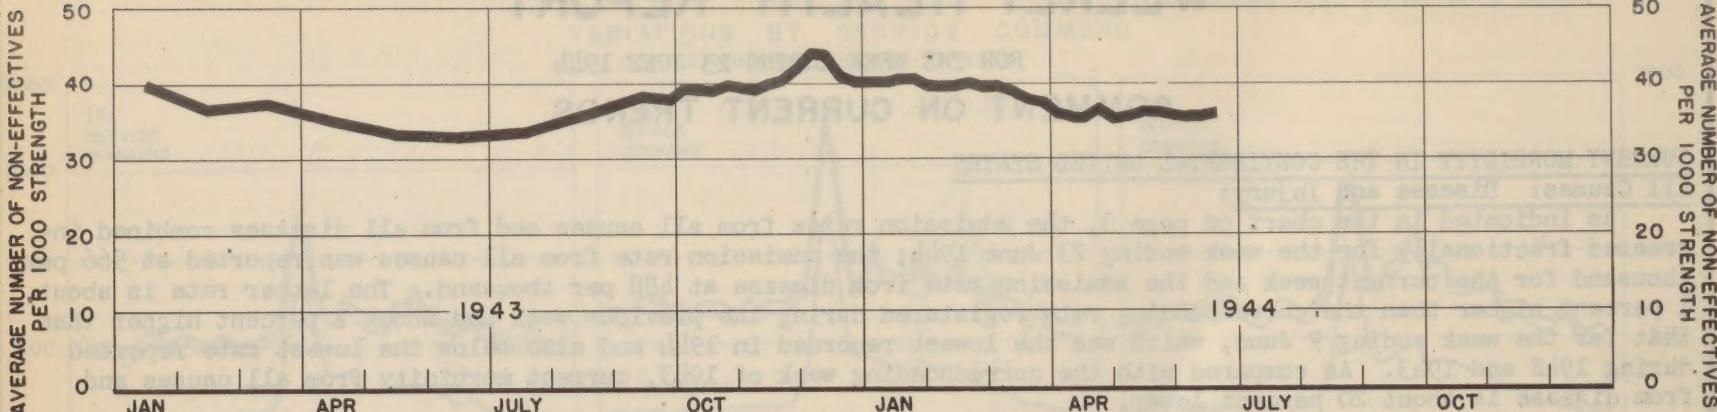

The number of new cases of measles, mumps, and scarlet fever all declined during the current week. The number of new cases of measles and scarlet fever were by far the lowest recorded for any week this year, while the number of new cases of mumps was the lowest since the week ending 7 January. The number of new cases of meningitis remained about the same as in the previous week which was the lowest level reported so far this year. The number of new cases of rheumatic fever decreased by about 20 percent and was the lowest recorded for any week since 7 January 1944.

#### VARIATIONS IN MORBIDITY BY SERVICE COMMAND

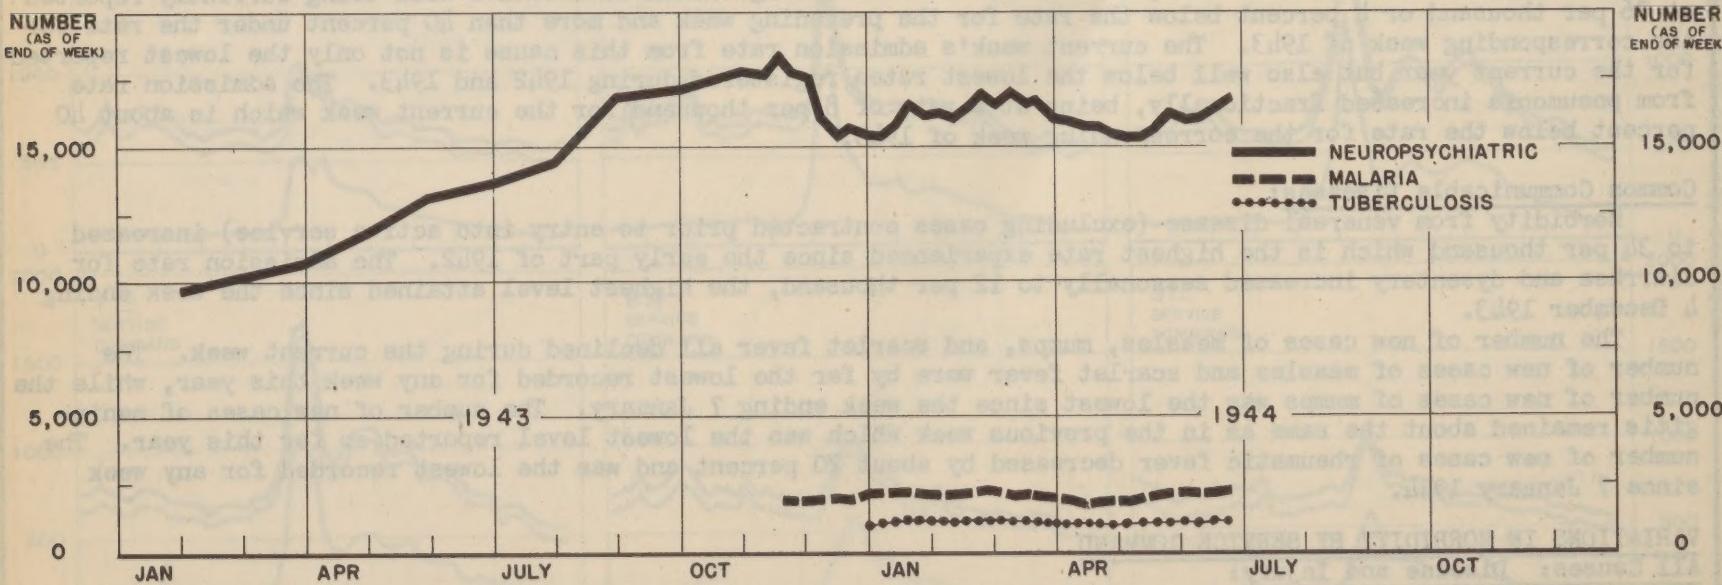

#### All Causes: Disease and Injury:

Changes in morbidity from disease were of relatively small magnitude in most Service Commands. However, the Military District of Washington showed a sizeable increase and as a result reported the highest admission rate for

# NON-EFFECTIVE RATE CONTINENTAL UNITED STATES

# PATIENTS REMAINING UNDER TREATMENT CONTINENTAL UNITED STATES

# WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 23 JUNE 1944

## COMMENT ON CURRENT TRENDS (CONT'D)

disease (556 per thousand); the lowest admission rate from disease was experienced in the First Service Command (442 per thousand).

The Fourth and Eighth Service Commands registered sharp increases in the admission rate from injury, the rates for the current week being 9 $\frac{1}{4}$  and 8 $\frac{1}{4}$  per thousand respectively. The increase in the Fourth Service Command was almost entirely accounted for by increased admissions at Camp Forrest, Tenn. and Camp Blanding, Fla., whereas in the Eighth Service Command the increase was the result of higher admissions at a number of stations.

### Respiratory Causes:

Most of the Service Commands reported substantially the same admission rate from colds, influenza, etc. A sharp increase in morbidity from this cause occurred in the Second Service Command (principally because of increased admissions at Camp Kilmer, N.J.) so that this Command reported the highest admission rate (117 per thousand). On the other hand, significant decreases in morbidity from colds, influenza, etc. occurred in the Third and Seventh Service Commands. As a result, for the first time in several weeks the Seventh Service was no longer the one with the highest morbidity from this cause. With the exception of the Second Service Command, none showed an admission rate for this cause in excess of 90 per thousand; the lowest rate (60 per thousand) was reported by the Fourth Service Command.

### Common Communicable Diseases:

Morbidity from venereal diseases, excluding EPTS cases, remained relatively high in the Second and Fifth Service Commands (at about 50 per thousand), whereas the First Service Command, which had reported a rate of about this magnitude during the previous week, showed a sizeable decrease during the current week. The Second Service Command experiences relatively high morbidity from this cause because of the incidence among task force troops not under its jurisdiction.

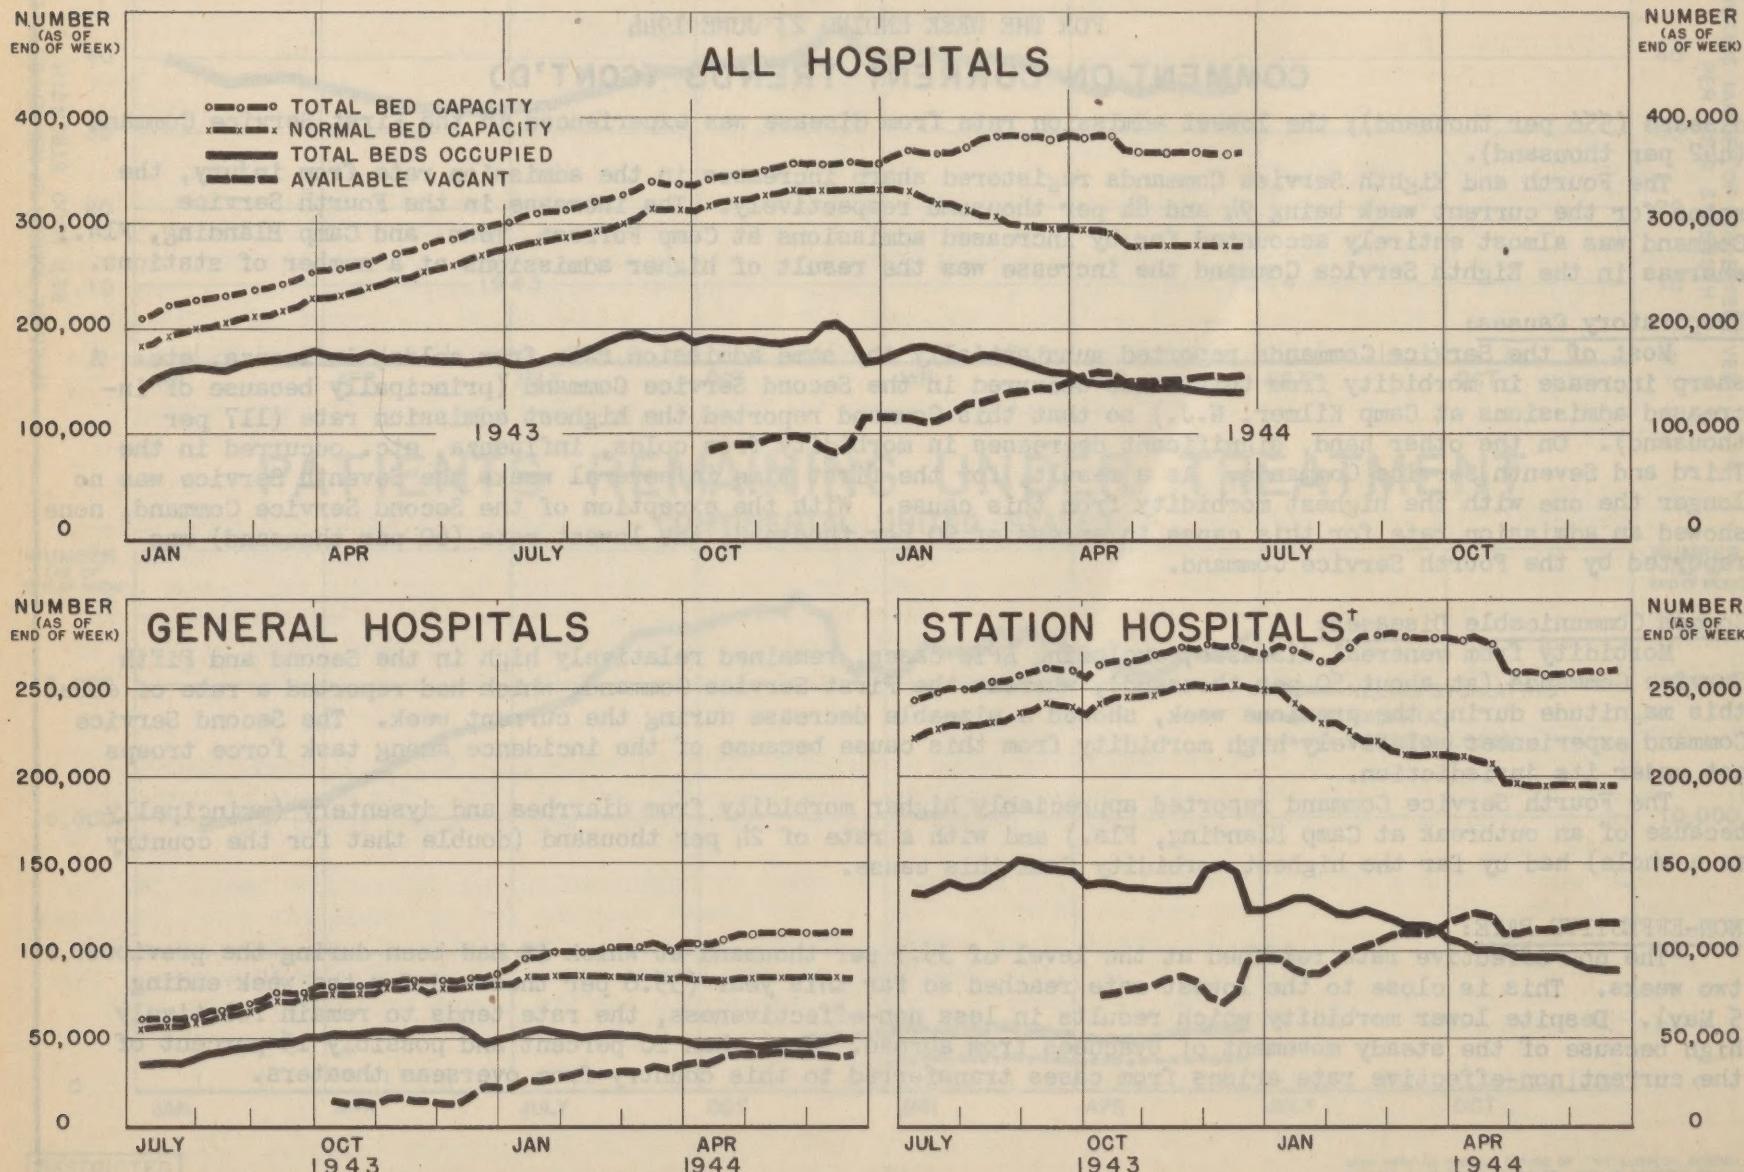

The Fourth Service Command reported appreciably higher morbidity from diarrhea and dysentery (principally because of an outbreak at Camp Blanding, Fla.) and with a rate of 2 $\frac{1}{4}$  per thousand (double that for the country as a whole) had by far the highest morbidity from this cause.

### NON-EFFECTIVE RATE:

The non-effective rate remained at the level of 35.9 per thousand at which it had been during the previous two weeks. This is close to the lowest rate reached so far this year (35.6 per thousand for the week ending 5 May). Despite lower morbidity which results in less non-effectiveness, the rate tends to remain relatively high because of the steady movement of evacuees from abroad. More than 10 percent and possibly 15 percent of the current non-effective rate arises from cases transferred to this country from overseas theaters.

# HOSPITALIZATION DATA\*

CONTINENTAL UNITED STATES

# WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 23 JUNE 1944

## COMMENT ON CURRENT TRENDS (CONT'D)

### PATIENTS REMAINING UNDER TREATMENT:

The total number of Army patients remaining in hospital at the end of the week remained at 35 per thousand strength. The number of neuropsychiatric cases remaining as of 23 June 1944 was reported at 16,758 or about 450 more than for the previous week and the highest number recorded since 10 March 1944. The number of malaria cases under treatment has increased steadily in recent weeks from a low of 1,748 on 14 April to 2,200 on 23 June 1944, the highest level attained so far this year; only 37 of these cases presumably were acquired in the United States. The number of tuberculosis cases remaining under treatment was reported at 1,127. The number of battle casualty patients remaining as of 23 June was 6,916 which is the highest figure reported so far.

### CURRENT HOSPITAL CONDITIONS:

The total bed capacity as of 23 June 1944 was reported at about 367,800 or slightly higher than as of the end of the previous week. The number of beds occupied was 138,500 or about the same as for the previous week, while the number of "available vacant" beds was 156,000. Total beds occupied represented 38 percent of total bed capacity. There were 7 stations with bed capacity of about 6,000 having no "available vacant" beds; two General Hospitals with a bed capacity of about 4,000 included among them.

The number of normal beds remained at about 280,000 or 76 percent of the total bed capacity. Included in the normal bed capacity were 315 T/O hospital beds and tentage, while the total bed capacity included 332 such beds, of which 8 were occupied.

The total bed capacity of General Hospitals was reported at about 110,000 (the highest figure so far attained); about 49,000 of these beds (or 45 percent) were occupied. The "available vacant" beds at General Hospitals numbered 40,000. Normal beds at General Hospitals have been maintained at a level of about 85,000 since the beginning of the year.

The total bed capacity of Station Hospitals (including the relatively small number of T/O hospital beds and tentage mentioned above) was 258,000. Normal beds in these hospitals remained at about 195,000. Total beds occupied as of 23 June 1944 numbered 90,000 (or 35 percent of the corresponding total bed capacity) which is the lowest level reported during 1943 and 1944 to date. Station Hospitals had 116,000 "available vacant" beds as of 23 June 1944.

The letters (RH) appear after the names of stations which have been designated as AAF or ASF regional hospitals in accordance with Section II, WD Circular No. 228, cs.

As of 23 June 1944 the bed capacity of convalescent facilities in General Hospitals numbered 14,546 beds of which 4,438 beds (or 31 percent) were occupied.

FOR THE WEEK ENDING 9 JUNE 1944

## COMMENT ON ADMISSION RATES TO HOSPITAL AND TO QUARTERS

For the week ending 9 June 1944 a special study was made to develop admission rates from disease and from injury, separately for cases which involved hospitalization and for those which involved confinement to quarters only. Accordingly, the data have been tabulated so as to include with admissions to hospital all cases originally admitted to quarters and then transferred to hospital. This procedure gives a reasonably accurate picture of the aggregate admission rate to hospital and the net admission rate to quarters for cases confined to quarters only.

For the continental United States as a whole the all causes admission rate of 550 per thousand strength was composed of rates of 507 per thousand for hospital admissions and 43 per thousand for quarters admissions (as defined above). Thus only 8 percent of the total admissions were cases involving confinement to quarters exclusively. The proportion was about the same for disease admissions since they comprise the great majority of the admissions from all causes. However, for injury admissions the proportion which were quarters cases was about 10 percent.

Previous studies along the same lines were made for the last weeks of January, February, and March. In these studies the quarters admissions represented 13, 10, and 9 percent of the total admissions respectively. The corresponding figure of 8 percent for the week ending 9 June is lower chiefly because of the continued decrease in morbidity from respiratory diseases, which at many stations account for a sizeable proportion of the quarters cases. The proportion of total admissions

involving confinement to quarters only varied from a low of 4 percent in the Sixth Service Command to a high of 12 percent in the Military District of Washington. Because of its unique composition previous studies also showed a high proportion of quarters cases in the Military District of Washington.

Stations with strength of less than 5000 had somewhat higher proportions of quarters cases. For the week ending 9 June 1944 about 14 percent of the total admissions in such units involved confinement to quarters exclusively in contrast with 6 percent for larger units. The reasons for the high proportion of quarters cases in small units is that such organizations frequently have only dispensaries and necessarily treat in quarters many of their less seriously ill who, if they had been at a post with a station hospital, would have been treated in the hospital.

The following stations all with strength of 5000 or more had quarters admission rates from all causes combined in excess of 300 per thousand: Mississippi Ordnance Plant, Miss., Ft. Oglethorpe, Ga., Wright Field, Ohio, Camp Joseph T. Robinson, Ark., and Camp Pinedale, Calif.
